

Wavepacket vs eigenstate current correlators: exact real-time spectra and matrix-pencil lines
 $N_s = 12$, $J_1 = \text{sum_b bond current (P = k_j)}$: C(t) spectra, $T = 200$, $dt = 0.1$

$N_s = 12$, $J_0(c)$ local at $c = 6$ (all P): C(t) spectra, $T = 200$, $dt = 0.1$

$N_s = 12$, J_1 : packet lines by assigned (n, P/q) [gray: eigenstate; triangles: window levels not exposed]

$N_s = 12$, J_0c : packet lines by assigned (n, P/q) [gray: eigenstate; triangles: window levels not exposed]

$N_s = 16$, $J_1 = \text{sum_b bond current (P = k_j)}$: C(t) spectra, $T = 200$, $dt = 0.1$

$N_s = 16$, $J_0(c)$ local at $c = 8$ (all P): C(t) spectra, $T = 200$, $dt = 0.1$

$N_s = 16$, J_1 : packet lines by assigned (n, P/q) [gray: eigenstate; triangles: window levels not exposed]

$N_s = 16$, J_0c : packet lines by assigned (n, P/q) [gray: eigenstate; triangles: window levels not exposed]
